

# AI-CliniScan: Dataset Description Document

**Author:** Tirumani Surya

**1. Overview** The AI-CliniScan project utilizes the VinDr-CXR dataset to train a deep learning system capable of detecting and localizing lung abnormalities. The dataset is primarily sourced from the Kaggle competition "VinBigData Chest X-ray Abnormalities Detection."

**2. Data Volume and Format** The dataset comprises 18,000 postero-anterior (PA) view chest X-ray images.

- **Image Format:** The raw images are provided in the DICOM format.
- **Annotation Format:** The diagnostic labels and bounding box coordinates are provided in a single CSV file format.

**3. Diagnostic Classes** The dataset contains bounding boxes and diagnosis labels. The system utilizes this data to identify key pathological findings. These clinical findings include, but are not limited to:

Opacities , Consolidations , Fibrosis , Masses , Optional classifications for related conditions like pneumonia or tuberculosis.
